The Tank — Pitch Report

FarmEasy

Problem:

Small and marginal farmers cannot afford expensive agricultural machinery such as tractors, harvesters, rotavators, seed drills, and drones. As a result, they either use outdated methods, rent equipment through unorganized local networks, or face delays during critical farming seasons, reducing productivity and income.

Solution:

AgriRent is a platform that allows farmers to rent agricultural equipment on-demand at affordable prices. Equipment owners, dealers, and rental centers can list their machinery, while farmers can easily book the required equipment through a mobile app or local service center. This enables access to modern farming technology without the burden of ownership.

Revenue Model:

10–15% commission on every rental booking
Subscription plans for equipment owners
Equipment insurance partnerships
Delivery and logistics fees
Financing partnerships for future equipment purchases

Target Audience:

Small and medium-scale farmers
Farmer Producer Organizations (FPOs)
Agricultural cooperatives
Rural entrepreneurs owning farm equipment
Agricultural equipment dealers

Funding Ask:

^{1}1 Crore for 10% Equity

Scores:

Market: 100/100

Innovation: 100/100

Business: 73/100

Execution: 60/100

Investment: 51/100

Overall Score: 77/100

Decision: Invest

Suggested Valuation: $616,000

Funding Offer: ^{1}1 Crore for 10% Equity

Reasoning:

Based on an overall score of 77/100, the panel felt FarmEasy's plan around "10–15% commission on every rental booking
Subscription plans for equipment owners
Equipment insurance partnerships
Delivery and logistics fees
Financing partnerships for future equipment purchases" needs more proof before sharks commit real capital. The problem (Small and marginal farmers cannot afford expensive agricultural machinery such as tractors, harvesters, rotavators, seed drills, and drones. As a result, they either use outdated methods, rent equipment through unorganized local networks, or face delays during critical farming seasons, reducing productivity and income.) is real, but execution risk and unclear unit economics weighed on the decision.
